THEME: MAKING HEALTHY FOOD CHOICES

ESSENTIAL QUESTION

How can we tell the difference between whole foods versus processed foods?

LEARNING OBJECTIVES

- ✓ Students will be able to draw connections between common foods and their sources.
- ✓ Students will be able to interpret the information on a nutrition label to identify whole, minimally processed, and highly processed foods.
- ✓ Students will be able to articulate the health benefits of eating whole and minimally processed foods.

LESSON DESCRIPTION

In this lesson, students play a game to identify foods and match them to their sources. They then learn the definition of minimally versus highly processed foods and, in groups, apply that understanding to sort various food products that share an original, whole food source.

MATERIALS

- Tape or glue
- Matching Food Source Cards (pp. 363–366)
- 5 sets of Processed Spectrum Sets (pp. 367–371)
- 5 zip lock bags (or other container) to hold food source sets
- 5 pieces of chart paper (1 for each group)

PREPARATION

- › Photocopy and cut out Matching Food Source Cards.
- › Photocopy and cut out Processed Spectrum Sets, and put each set into a zip lock bag.

ACTION STEPS

1. What Food Am I?: Have students gather in a circle. Explain, *I'm going to tape a picture of a food onto each of your backs. Then we're going to play a game called "What Food Am I?" where we have to ask each other yes/no questions to figure out what we have on our backs. For example, I could ask "Am I fruit?" Or "Do I come in packaging?" Or "Am I spicy?" Could I ask "What color am I?"* (No, because that's not a yes/no question). Tape a food image to students' backs, making sure their match is in the mix. Remind students to keep the foods they see on their classmates' backs a secret and that the game isn't fun if we give away the food without the person guessing. Start the game and have students walk around the room, asking each other yes/no questions. If a student guesses their food, the student can move the card onto their front and continue answering questions for other players. Model with the classroom teacher as your partner before the game starts. Give students about five minutes to play and then call them back into a circle. **(10 min.)**

2. Connecting to the Source: Ask, *What did you notice about the different types of food pictures we had? Say, You might have noticed that some of you were whole foods, like a fruit or vegetable, and some of you were food products, things to eat that you make from whole foods. A whole food is food in its natural state that has been processed as little as possible, like a tomato, a berry, or corn, whereas a product is something you make with a whole food, like jam or french fries, and it might come in packaging if you buy it at the store. Explain that now that they know what foods they have, they're going to stand up and try to find their match. Each food product has a whole food source match. For example, orange juice would match to an orange. Tell students once they find their match they should return to the circle to sit with their partner. Give students about five minutes or until everyone is back in the circle, and have pairs share how they know they're a match. (10 min.)*

3. Defining Processed Foods: Say, *Raise your picture up in the air if you could be taken straight from a garden or farm. You're all the whole foods! Raise your picture up in the air if a person has to do some work to make you. You're all the food products or processed foods! What does it mean to be processed?* Field responses from students, and get to the idea that a processed food has been changed from its original form. Explain that people process foods by mashing them, cooking them, or blending them with other ingredients. This makes the food more convenient to eat, helps the food last longer, or changes the food's taste or texture. Explain, *There is a whole spectrum of food products from minimally to highly processed foods. Foods that are minimally*

processed are still really close to their original food source. For example, applesauce can be as simple as apples cut up and cooked down with nothing else added or maybe just a little cinnamon, lemon, and sugar. But the more original food is changed, and the more ingredients that are added to it, the more highly processed it becomes. (5 min.)

4. Reading Nutrition Labels: Show students a copy of the nutrition label for peanut butter. Explain that the first ingredient listed is what the product has the most of, and the ingredients go in decreasing order. Say, *The more ingredients you see listed there, the more highly processed the product is. Also, if you see ingredients like "diglycerides," that you don't recognize or have trouble pronouncing, that probably means it's a chemical ingredient to change the color or texture or a preservative to make the product keep on the shelf longer. (5 min.)*

5. Sorting Processed Spectrum: Show students one of the Processed Spectrum Sets, and explain that they'll arrange the pictures of foods from whole foods, to minimally processed, to highly processed. Have the students tape or glue their food pictures in order on chart paper. Tell students to be ready to explain why their group ordered the foods the way they did. Divide students into five groups, and pass out a bag to each group. As they sort their food items, circulate through the room, asking probing questions and encouraging students to read the ingredients lists. (10 min.)

6. Gallery Walk: Have groups display their spectra for the class. Then have students circulate through the room, observing other groups' arrangements and writing questions

or comments on post-its that they add to each spectrum. Then have each group share their spectrum and answer any questions that arose. **(15 min.)**

REFLECTION

Have students discuss the following questions in small groups, then share with the class: **(5 min.)**

- *Why is it important to distinguish between minimally and highly processed foods?*
- *How can you tell if something is a whole food?*
- *How can you tell if something has been processed?*
- *How did your group decide that a food was more processed than another food?*

ADAPTATIONS

Variation: Play a version of the game in which half the students have a food product and the other half have ingredients lists, and students must find which product they think they are based on their ingredients list.

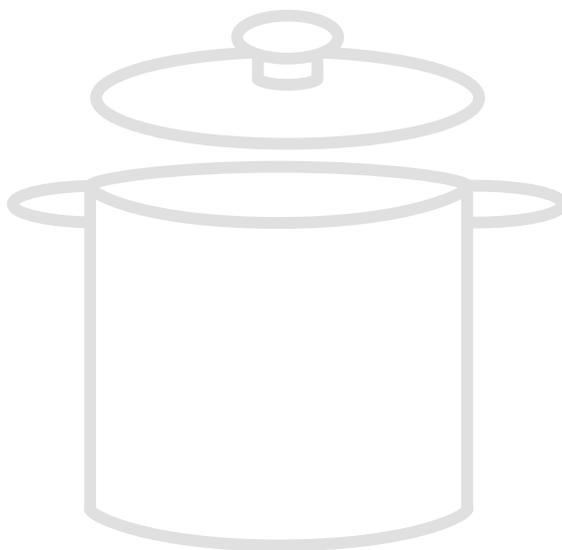

At Home: Have students record snacks and meals they eat during the week, and label where each food falls on a whole versus highly processed spectrum.
